### **BellHawk Systems Releases Latest Version of its Popular Wireless Mobile Data Collection and Barcode/RFID Tracking Software**

*Updated software provides critical Tracking and Traceability Capability*

BellHawk Systems Corporation today announced the release of BellHawk Version 4.9. BellHawk now provides materials tracking and traceability capability from the receiving dock to the shipping dock and beyond. This capability is critically important to food processors and distributors as well as to manufacturers whose products are critically linked with health and human safety. It is also a critical link in the war on terrorism.

To quote Dr. Peter Green, the architect of the BellHawk software: “It feels good that we are able to help protect people from bioterrorism attacks.” Dr. Green has been giving talks to food processing groups around the country about the dangers of substances like ricin, a small amount of which could kill tens of thousands of people if mixed into the food supply. “There is no cure for ricin, it will kill you if you ingest it, but with software like BellHawk we can quickly find the contaminated material and recall it before it kills many more people.”

The BellHawk software provides the data collection link between a wide variety of data collection devices such as wireless mobile computers and RFID equipment and an organization’s financial, enterprise resource planning and other legacy systems.

With the data captured by BellHawk it is now possible to rapidly trace back from defective finished goods to contaminated materials used in manufacturing and to the people directly involved in manufacturing the defective batches. Once the source of a problem has been detected BellHawk can provide a list of all contaminated finished goods and where they were shipped to. This avoids the difficulty and cost of massive recalls, such as we saw in the Menu Foods dog food case. Instead it enables just the contaminated materials to be quickly found and recalled.

BellHawk's special niche is semi-custom tracking and data collection systems. Through its modular design, BellHawk provides IT departments and their systems integrators with a rapid and cost effective way of implementing systems tailored to their specific business needs. BellHawk provides an alternative to packaged software, which does not meet the tracking and traceability needs of many businesses, and custom software development which can be costly, time consuming and risky. By using BellHawk for data collection, IT managers can avoid extensive customizations to their ERP or accounting systems. Such customizations inhibit easy upgrades and can prove costly.

BellHawk Systems is a Motorola Independent Software Vendor (ISV) partner and provides support for a wide range of Motorola wireless mobility and RFID equipment. BellHawk Systems is also a Microsoft ISV partner and its software has been tested and certified by Microsoft.
